Flow chart 13.1 Mandibular 1st molar—major anatomic landmarks

Box 13.1 Mandibular 1st molar—identification features

Identification features of mandibular 1st molar

- The mandibular 1st molars have five cusps and two well formed roots
- The distal cusp is the smallest cusp and helps to identify the tooth and its side.

Side identification

- Smallest cusp, i.e. the distal cusp helps in identifying the side
- Roots often show distal curvature.

Mandibular 2nd Molar

Figure 13.17 Mandibular 2nd molar—distal aspect

Flow chart 13.4 Mandibular 2nd molar—summary

Identification features of mandibular 2nd molar

- The mandibular 2nd molar has four cusps and two roots
- The occlusal aspect has a plus '+' or cross-shaped groove pattern, dividing the occlusal surface into four nearly equal parts
- Both the roots are distally inclined and extend parallelly and are close to each other
- Viewed occlusally, there is cervical prominence seen at mesiobuccal line angle of the crown.

Side identification

- Viewed from occlusal aspect, the crown is wider mesially than distally
- Often, there is a prominence cervically near mesiobuccal line angle when viewed from occlusal aspect
- The roots are inclined distally.

Flow chart 13.5 Mandibular 3rd molar—major anatomic landmarks

Box 13.3 Mandibular 3rd molar—identification features

Identification features of mandibular 3rd molar

- Usually, the mandibular 3rd molars are similar to mandibular 2nd molars but a little smaller in size
- The occlusal surface shows more number of supplemental grooves
- The roots are shorter and more pointed and have an extreme distal tilt
- They often have fused roots.
