

anterior teeth

upper central incisor

Maxillary central incisor

Maxillary central incisor

Maxillary central incisor					
Crown					Root
Labial aspect	Lingual aspect	Mesial aspect	Distal aspect	Incisal aspect	
Geometric form • Trapezoidal • Mesioincisal angle—sharp • Distoincisal angle—rounded • Incisal ridge—very straight • Labial surface—smooth, convex both cervico-incisally and mesiodistally • Height of labial contour—at cervical third	• Trapezoidal • Crown converges lingually • Lingual surface—irregular • Cingulum in cervical third • Shallow lingual fossa in middle and incisal third • Usually 2 developmental grooves in lingual fossa • Height of lingual contour—at cervical third	• Wedge/triangular shaped • Labial outline—convex • Lingual outline—concavoconvex • Height of labial contour—at cervical 3rd • Height of lingual contour—at cervical 3rd • Cervical line—curves incisally (maximum curvature among all teeth 3.5 mm) • Incisal ridge is in line with vertical root axis • Mesial contact—area at incisal 3rd near incisal ridge	• Wedge/triangular • Curvature of cervical line 1 mm shorter (2–5 mm) • Distal contact area junction of incisal and middle third	• Triangular • Appears bulky from incisal view • Wider mesiodistally than labiolingually • Labially broad and convex • Lingually—cingulum seen • Incisal edge—clearly seen sloping lingually perpendicular to labiolingual bisecting line	Number • Single Size • 2–3 mm longer than crown Form • Conical root, evenly tapers to apex Cross-section at cervix • Triangular with base labially and apex lingually Apical root curvature • Usually straight, sometimes labial curvature Apex • Blunt

Maxillary lateral incisor

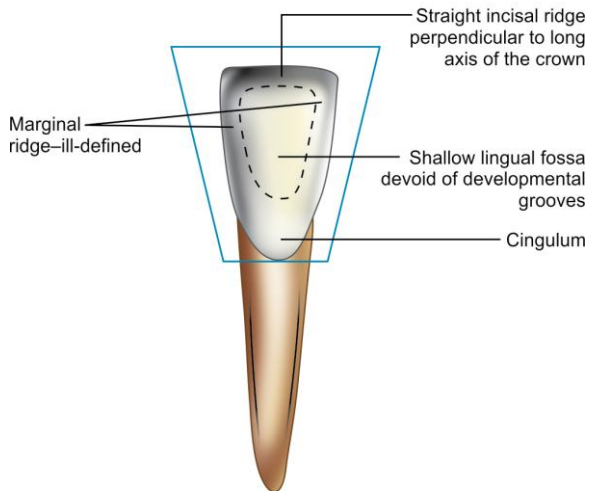

Maxillary lateral incisor

Crown (smaller and shorter than that of central incisor)					
Labial aspect	Lingual aspect	Mesial aspect	Distal aspect	Incisal aspect	Root
Geometric form • Trapezoidal • Cervical line—curves apically • Mesial outline—straight • Distal outline—shorter • Mesioincisal angle—rounded • Distoincisal angle—more rounded • Incisal ridge—more rounded not straight • Labial surface is more convex than that of central incisor	• Trapezoidal • Crown converges lingually • Marginal ridges more pronounced • Cingulum more prominent • Lingual fossa deeper and well circumscribed • Deep developmental grooves often present • Palatogingival groove may be present • Lingual pit and tubercle common	• Wedge/triangular • Labial outline convex • Height of labial contour cervical 3rd • Lingual outline—concavoconvex • Height of lingual contour at cervical 3rd • Cervical line curves incisally • Incisal ridge is in line with root axis line • Mesial contact area—at junction of incisal and middle 3rd	• Wedge/triangular • Curvature of cervical line 1 mm lesser • Palatogingival groove may be seen crossing cingulum	• Oval • Wider labiolingually than mesiodistally • Crown more convex labially and lingually than central incisor	Number • Single Size • Slender and proportionally longer Form • Conical root Developmental groove • On mesial and distal surfaces Apical root curvature • Usually distal curvature also labial curvature Cross-section at cervix • Oval

Mandibular lateral incisor					
Crown					Root
Labial aspect	Lingual aspect	Mesial aspect	Distal aspect	Incisal aspect	
Geometric shape • Trapezoidal Crown outlines • Mesial – Straight – Longer than distal outline • Distal – Slightly convex Crown symmetry • Bilaterally asymmetrical • Distal half larger Incisal angles • Mesioincisal—right angled • Distoincisor—rounded Incisal ridge • Straight • Slopes cervically in a distal direction • Mamelons in newly erupted tooth Labial surface • Smooth convex • Flat incisally	• Trapezoidal Lingual convergence • Present lingual Lingual fossa • Shallow • Devoid of developmental grooves Marginal ridges • Relatively well formed	• Trapezoidal/wedge Crown outlines • Labial—straight concavoconvex Incisal ridge location • Lingual to vertical root axis Lingual inclination of crown • Crown inclined lingually over root base Mesial surface • Longer than distal surface Mesial contact area • At incisal 3rd near mesioincisal angle	• Triangular/wedge Cervical line • Less curved Distal surface • Shorter than mesial surface Distal contact area • At incisal 3rd but cervical to mesial contact area	• Oval labiolingually Relative dimensions • Crown wider labiolingually than mesiodistally Symmetry • Crown bilaterally not symmetrical Incisal ridge • Not perpendicular • Is at an angle to labiolingual bisecting line • Curves distally	Number • Single Pulp canal • Single canal Size • Long root Form • Conical • Narrow mesiodistally wide and flattened labiolingually • Sometimes divided into buccal and lingual roots

Mandibular canine					
Crown					
Labial aspect	Lingual aspect	Mesial aspect	Distal aspect	Incisal aspect	Root
Geometric form • Trapezoidal	• Trapezoidal	• Triangular/wedge	• Triangular/wedge	• Oval	Number • Single
Crown outlines • Mesial—a straight line in line with mesial outline of root • Distal—slightly convex	Lingual convergence • Crown tapers lingually Cingulum • Less prominent • Poorly developed	Crown outlines • Labial—less convex • Lingual—less concave lingual fossa and less convex cingulum	Crown outlines • Similar to mesial aspect except that • Cervical line is less curved	Cingulum • Smaller	Pulp canal • Single
Height of mesial and distal contours/contact areas • Mesial—at incisal 3rd near mesioincisal angle • Distal—cervical to mesial contact area	Marginal ridges • Less prominent	Cusp tip • Thin, pointed	Distal contact area • Positioned cervically than the mesial	Lingual fossa • Shallow	Size • Long root
Cusp ridges/slopes • Mesial—shorter • Distal—longer	Lingual fossa • Shallow • Lingual surface less concave like that of mandibular lateral incisor	Cusp tip position • Is in center or lingual to the vertical root axis • Crown shows lingual inclination over root base		Cusp ridges • Curved lingually and not straight as in maxillary canine	Form • Conical, wider buccolingually
Cusp and labial ridge • Less prominent than maxillary canine	Lingual ridge • Less prominent • Divide lingual fossa into 2 small fossae	Mesial contact area • At cervical 3rd near mesioincisal angle		Cusp tip • Positioned lingually	
Labial surface • Crown appear longer • Crown appear tilted distally on root base due to straight mesial outline of crown and root
