

OCCLUSAL ASPECT 6

The geometric outline:

Rhomboidal

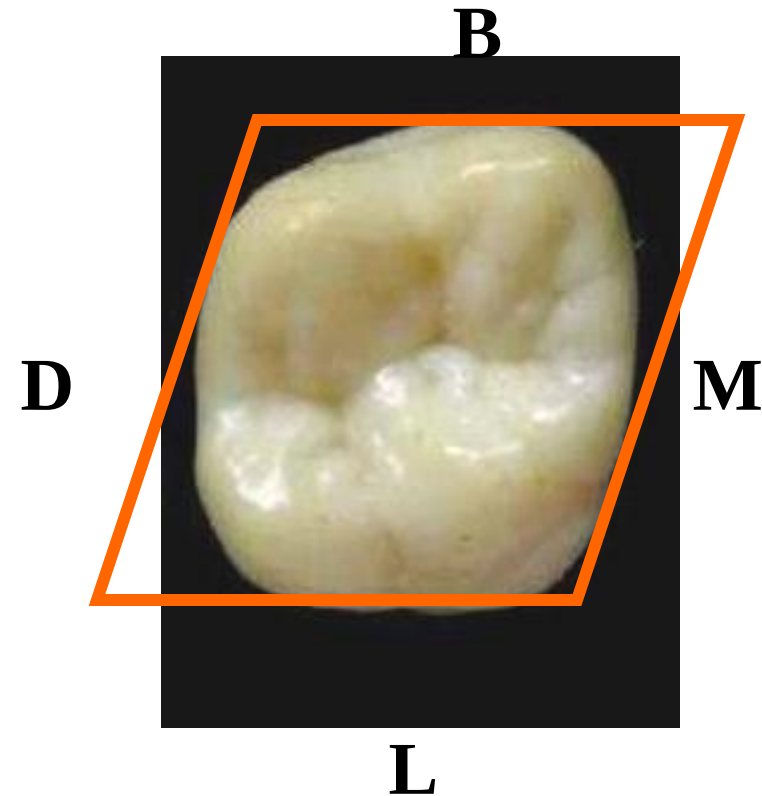

*DB, ML angles are obtuse.

*DL, MB angles are acute

Dimensions:

*Thickness > width

*Disto-buccal convergence ($D < M$ and $B < L$).

Anatomical landmarks:

Elevations:

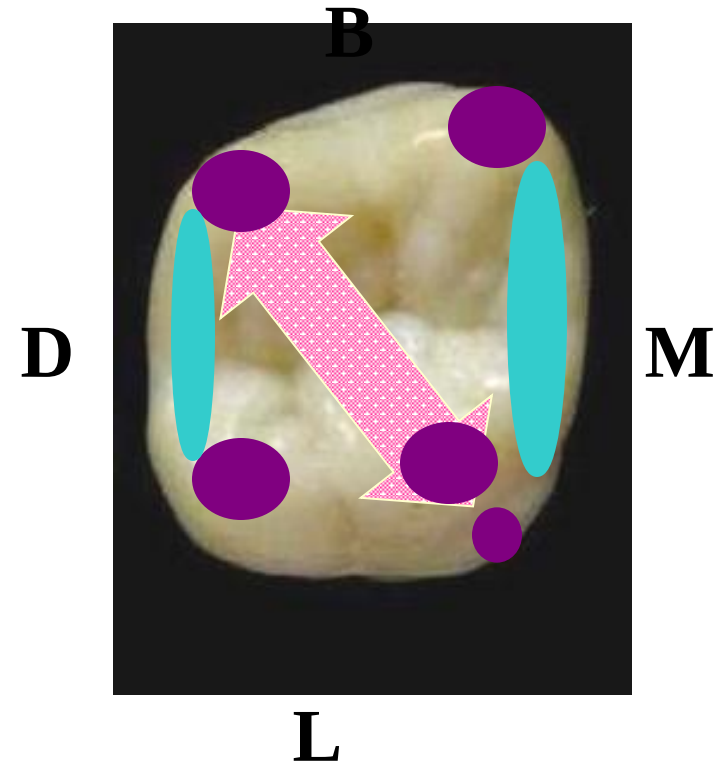

***4 cusps (from the largest to the smallest: MLC>MBC>DBC>DLC)**

with 5 triangular ridges.

***Tubercle of Carabelli.**

***Oblique ridge between triangular ridges of MLC&DBC.**

*** MMR and DMR**

Depressions:

*2 major fossae (central triangular & distal elongated)

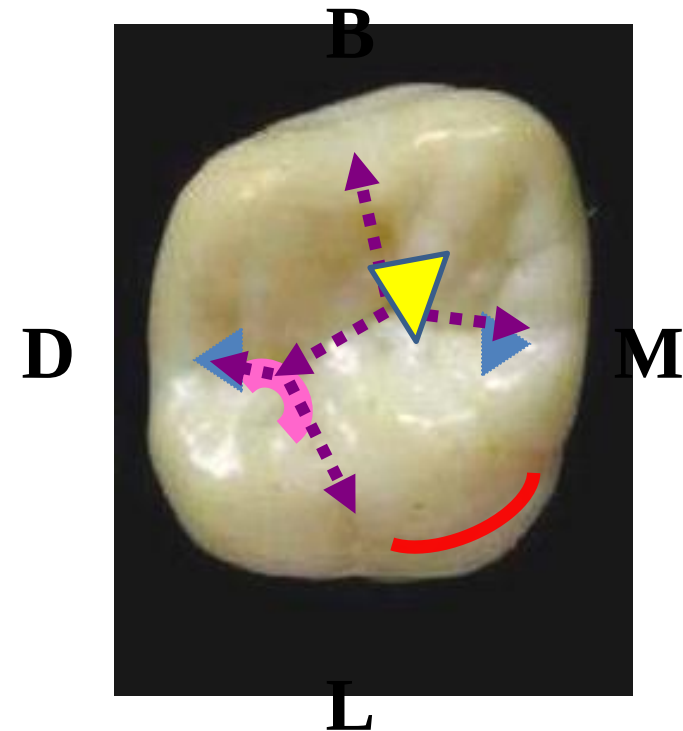

*2 Minor fossae (mesial and distal triangular fossae)

*Developmental grooves (DGs):

Buccal DG: from the central pit, separating the 2 buccal cusps.

Central DG: from the central pit to the mesial triangular fossa.

Transverse groove of oblique ridge: across the oblique ridge joining the 2 major fossae.

Distal groove: traverses the distal fossa and extends lingually between the 2 lingual cusps as the **Lingual DG**).

Fifth cusp groove: outlining the tubercle of Carabelli if it is well defined.

Supplemental grooves: may be found along the sides of mesial and distal triangular fossae.
